PROFESSIONAL SUMMARY

Motivated Backend .NET Developer with hands-on experience building scalable and production-style RESTful APIs using ASP.NET Core, Clean Architecture, CQRS, and MVC. Strong foundation in C#, OOP, LINQ, and database design with practical experience applying SOLID principles and design patterns to build maintainable and modular systems. Passionate about backend architecture, performance optimization, and writing clean, scalable, and production-ready code.

EXPERIENCE

Practical Training & Self-Directed Development

01/2023 – Present

- Designed and developed scalable RESTful APIs using ASP.NET Core and MVC architecture
- Applied Clean Architecture, CQRS, and SOLID principles to build maintainable systems
- Modeled business logic using Domain-Driven Design (DDD) and design patterns (Repository, Unit of Work)
- Implemented secure authentication & authorization using JWT and ASP.NET Core Identity
- Built features using Entity Framework Core and Dapper with optimized database queries
- Applied FluentValidation, Result Pattern, and Global Exception Handling for robust APIs
- Improved performance using Redis and In-Memory Caching
- Performed basic load testing using k6 and analyzed performance bottlenecks
- Worked with SignalR and gRPC for real-time and high-performance communication
- Containerized applications using Docker and deployed basics with Kubernetes
- Managed code using Git & GitHub with proper version control practices

PROJECTS

Review_Guard— Business Review Verification Platform 🔗

03/2026 – 07/2026

Tamper-resistant review platform built with .NET 8 using Clean Architecture, CQRS, and DDD.

- A backend API for a platform where customers leave reviews on businesses (restaurants, hotels, etc.), but reviews only count if the customer can prove they actually visited — via an uploaded receipt or order ID. Admins moderate every review and proof before it goes live, business owners get notified about activity on their branches, and a trust-score system tracks user reliability over time. Built with Clean Architecture and CQRS for a maintainable, scalable codebase, with rate limiting, caching, and bilingual (EN/AR) support baked in from the start.
- Key Technologies:** ASP.NET Core, C#, Entity Framework Core, MediatR (CQRS), FluentValidation, JWT Authentication, SQL Server, Clean Architecture, Repository Pattern, Redis/Caching, RESTful APIs, json.

Skeleton E-Commerce API 🔗

10/2025 – 03/2026

ASP.NET Core 10 Web API (Clean Architecture)

- Built a scalable E-Commerce Web API using ASP.NET 🔗 Core 10 following Clean Architecture principles (Domain, Application, Infrastructure, Presentation).
- Implemented CQRS pattern using MediatR, JWT authentication with role-based authorization, and centralized exception handling middleware.
- The system supports core e-commerce features including products, orders, payments, discounts, and customer accounts.
- Added real-time notifications using SignalR, background jobs using Hangfire, caching with Redis, and rate limiting for API protection.
- Designed to be modular, maintainable, and ready for enterprise-level scalability.

Key Technologies: ASP.NET Core 10 Web API, C#, Entity Framework Core, Clean Architecture, CQRS (MediatR), JWT Authentication & Authorization, SignalR, Redis, Hangfire, FluentValidation, Mapster, Swagger (OpenAPI), SQL Server

TaskManager

03/2024 – 07/2024

TaskManager — Task & Appointment Management System

A web-based system for managing tasks and appointments with automated notification services to keep users updated on deadlines and scheduling changes.

- Built using ASP.NET Core MVC following standard MVC architecture for clear separation of concerns
- Implemented task creation, scheduling, and appointment tracking features
- Integrated notification services to alert users about upcoming tasks/appointments
- Used SQL Server for data persistence and relational data management

Key Technologies: ASP.NET Core MVC, C#, SQL Server, Entity Framework

GameZone

09/2024 – 12/2024

GameZone — Compressed Game File Sharing Platform

An MVC web application that allows users to upload, manage, and share compressed game files with other users.

- Built using ASP.NET MVC architecture for structured request handling and clean separation of concerns
- Implemented file upload and compression handling for game files
- Designed user-friendly browsing/download flow for shared game files
- Used SQL Server for storing file metadata and user data

Key Technologies: ASP.NET MVC, C#, SQL Server, Entity Framework

EDUCATION

Bachelor of Computer Science

2021

Menofia University

CERTIFICATES

SQL Fundamentals Track

Sep 2025: (Introduction, Intermediate, Joining Data) **DataCamp**

TECHNICAL SKILLS

Programming & Core Concepts

C#, OOP, LINQ, Data Structures, Algorithms

Architecture & Design

MVC Architecture, Clean Architecture, CQRS, SOLID Principles, Domain-Driven Design (DDD), Design Patterns (Repository, Unit of Work, Strategy)

Databases

Microsoft SQL Server, PostgreSQL, Database Design, Query Optimization

Backend Development

ASP.NET Core Web API, ASP.NET MVC, Entity Framework Core, Dapper ASP.NET Core Identity, FastEndpoints, SignalR, gRPC RESTful API Design, FluentValidation, Localization

Caching & Performance

Redis, In-Memory Caching, Basic Load Testing (k6)

DevOps & Tools

Git, GitHub, Docker (Basics), CI/CD Pipelines (Basics), Swagger, Unit Testing (xUnit, NUnit)

LANGUAGES

Arabic

Native

English

Very Good Written and Spoken
